

ADVICE FOR INVEST EASY

to show my skills in UX

- My previous advice for Nortal <https://optim.ee/4nortal.pdf>
- Please note that Invest Easy's English and Arabic versions have some differences

1. Mobile version

Nothing happens if I tap on these links.

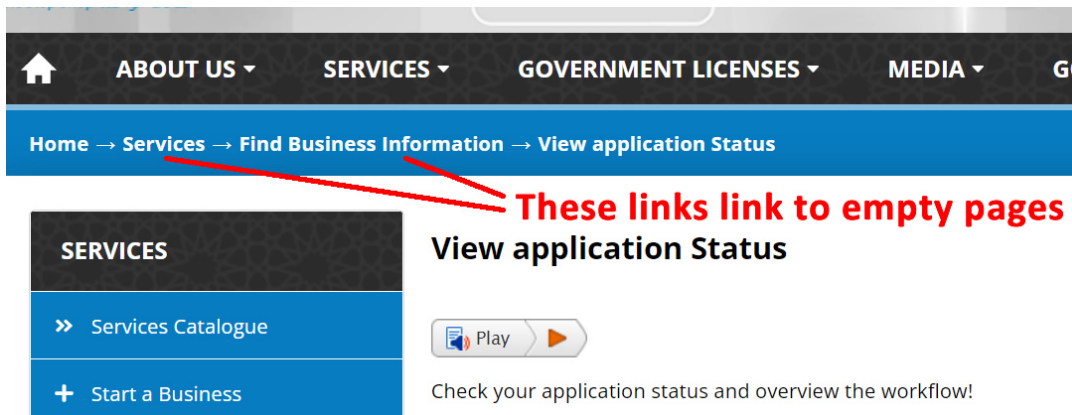

This happened because the same elements are tabs on Desktop.

On a mobile they actually change the content below, but often happens below a visible screen area, so users get a “nothing happens”, “not working” impression.

So, the solution:

After a tap – on a mobile - it should automatically scroll down to the next section on the page, where a change was actually triggered. (Tapping on “Start a Business” doesn’t trigger a change, as it is active by default, but automatically scrolling down after a tap is needed in this case, too)

2. Ghost pages that are EMPTY

These links link to empty pages

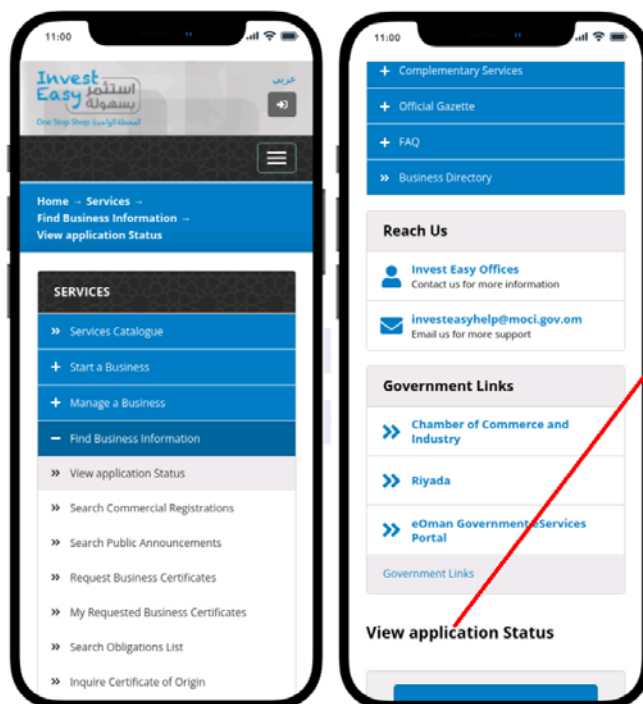

View application Status

The problem here is that linked pages are not a part of the website's main structure, but links to them appear in breadcrumbs where a hierarchical structure is shown.

The solution:

- Make these links not clickable
- Or do something with linked pages, like adding some minimal content or redirecting to first sub-sections.
 - Still, as these pages don't play a role in the main structure, a lot of work here is pointless, just do something to avoid an impression of technical errors or "under construction".

3. Mobile version again

A typical inner page

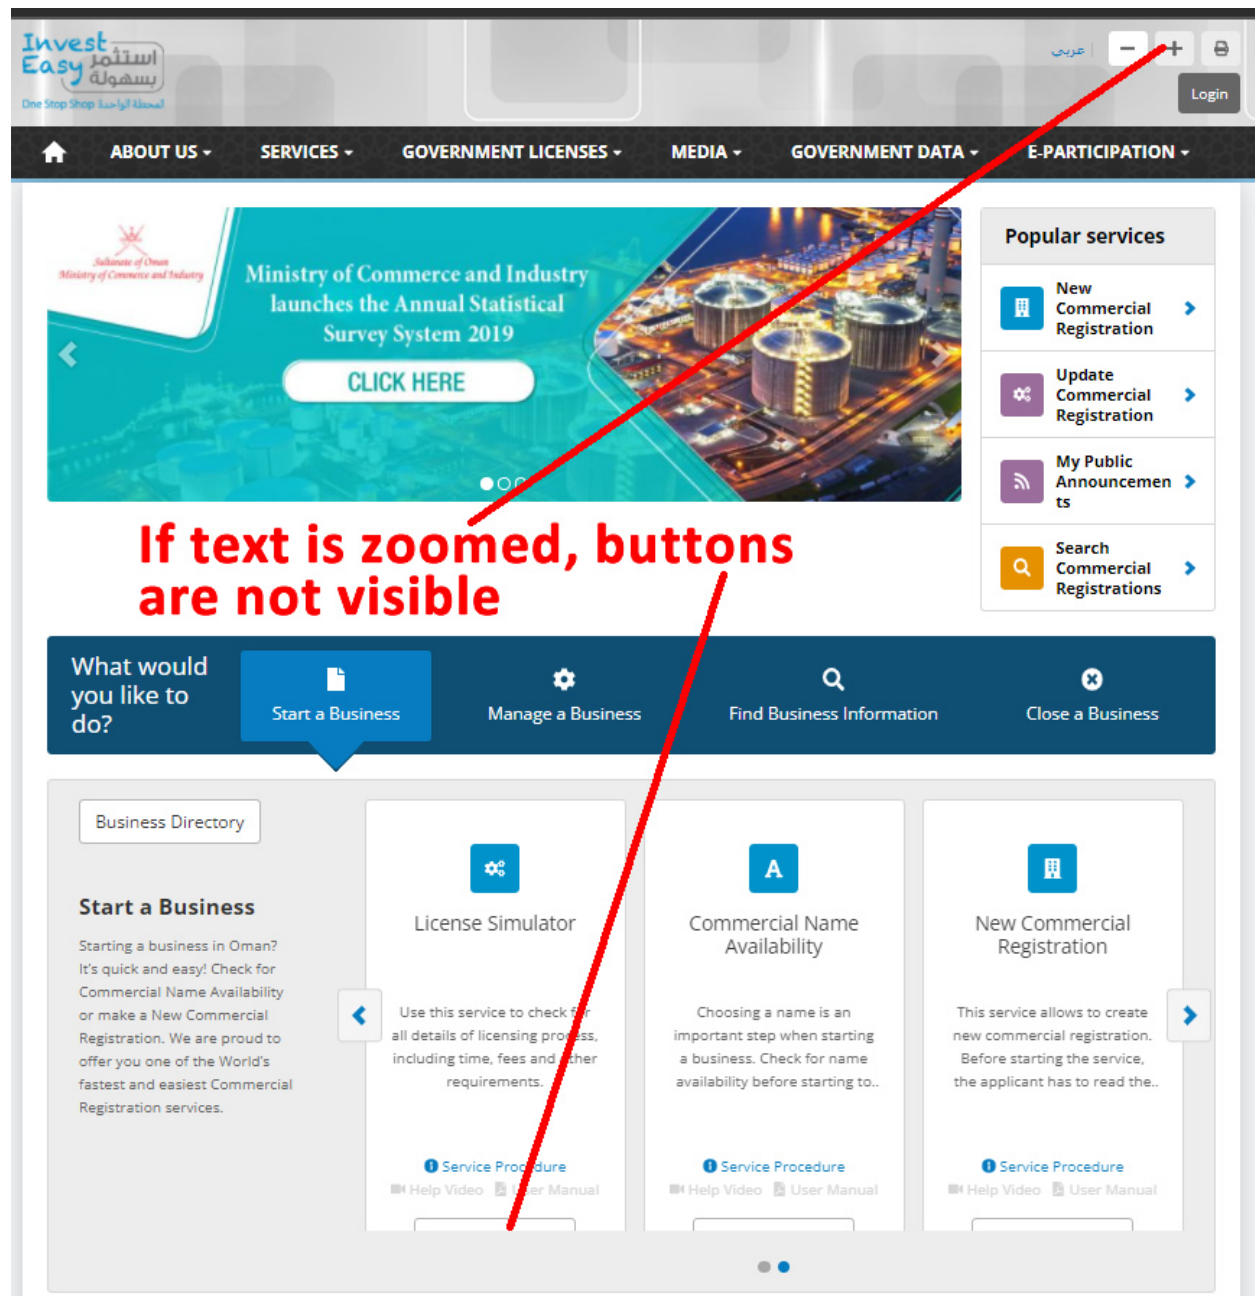

Main content is buried deep below. A lot of scrolling needed to finally see the main part of a page.

The solution:

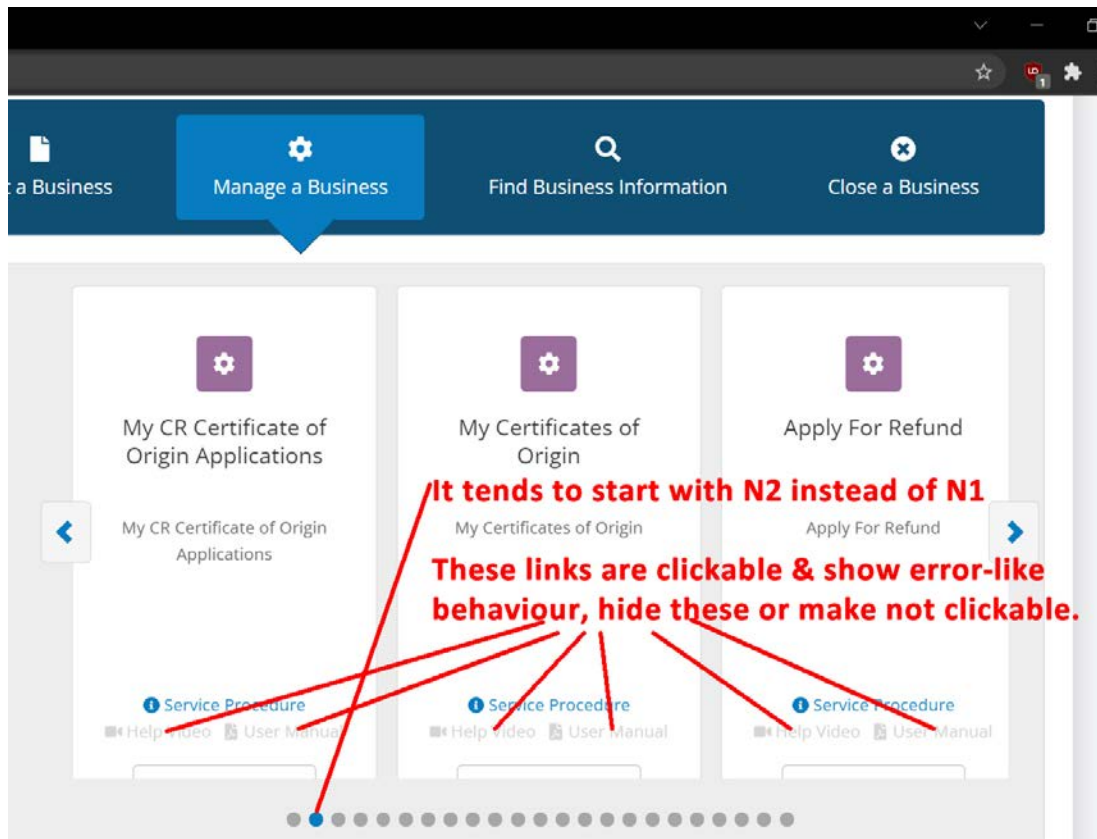

- Main content should be shown first on a mobile, it's easily fixed with CSS/JavaScript.
 - It seems that all is accessible via the main menu, too, so users won't miss anything if main content will be shown first.
- However, there is 1 specific page – Service Catalogue – where keeping the current version has a point.

4. Increasing text size

This issue is probably less presented on the Arabic part, but it's quite serious on the English part. The text is small (actually there is also a question why is it so small?), so a logical step for a user is to increase font size. As you see from the screenshot, it leads to disappearance of important buttons, as boxes simply don't adapt to the change correctly.

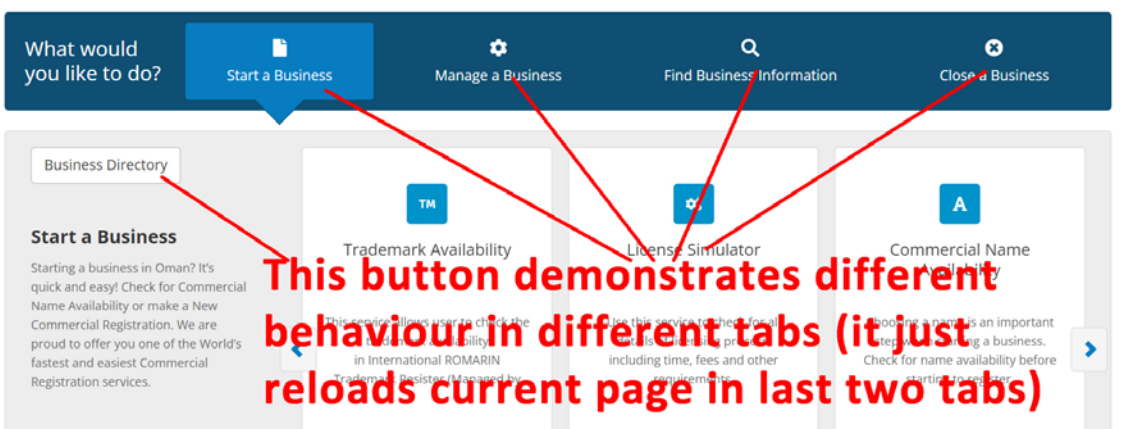

5. “Carousels”

The tabs seem to live their own life in the background, but it's not good, because users don't expect for a list to start from an element N2 or N3 and may skip important things. Also, I admit that the “carousel” is aesthetically nice, but it takes 22 clicks to get to the end, so a good idea is to add a possibility to switch to “List View”, especially if there are too many elements in a “carousel”.

6. “Business Directory” button

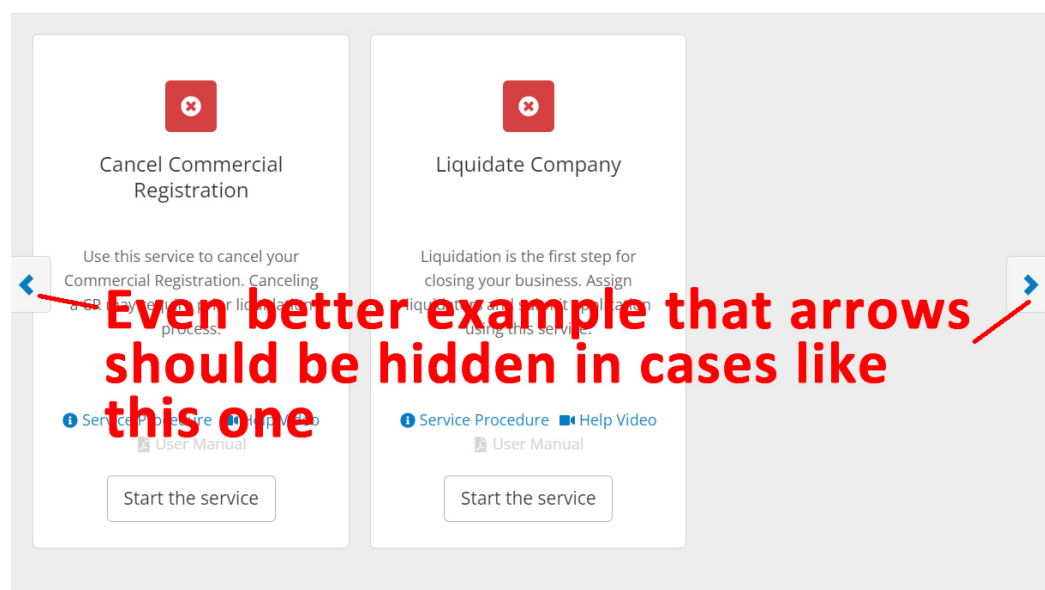

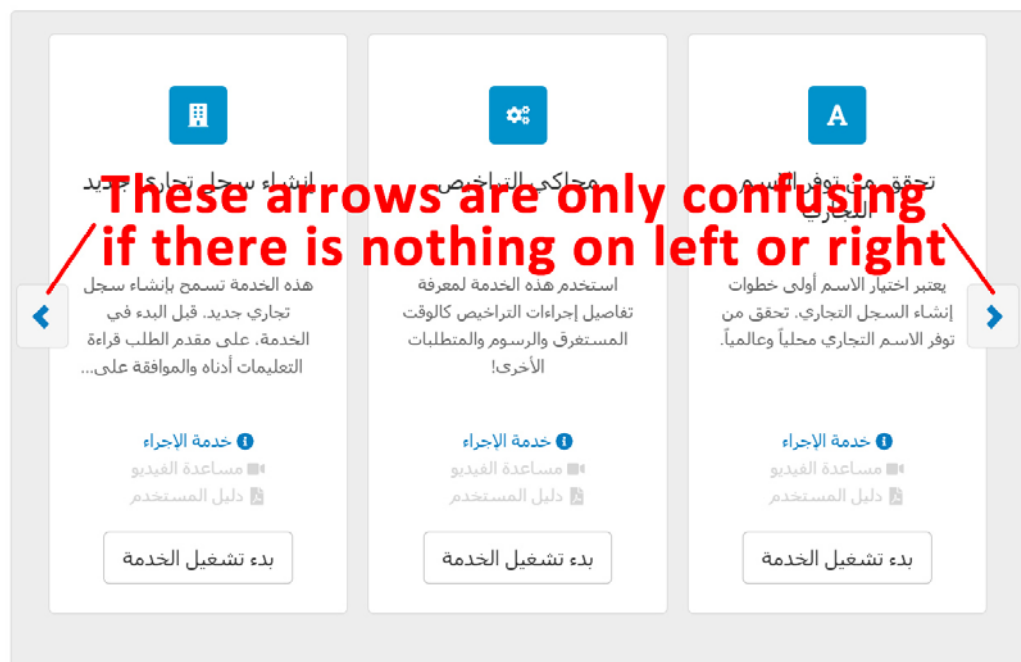

Also, it seems that the business directory is not ready yet, so it's probably wise to temporarily remove the button. Button's behavior in the last two tabs is the worst, as this is error-like behavior.

7. Arrows

I strongly recommend hiding arrows in cases where they don't do anything to avoid confusing users.

Also, consider hiding or graying out arrows if the end or beginning is reached, as they also don't do anything there.

Thanks!

- My previous advice for Nortal & Eesti.ee: <https://optim.ee/4nortal.pdf> - I also corrected it a bit
- Also, my advice for Pipedrive + CV + **top expert's opinion** about the quality of my advice: <https://optim.ee/ux.pdf>
